

Screen walkthrough

Every screen in the app, in the order you meet it. Captured from the `live` flavor on an API 36 emulator talking to `main`'s Next.js server, so the figures are real seeded data rather than mockups.

1. Opening and sign-in

The app opens on the client portal. `main` enforces an intro-to-login flow on launch (commit `3d842f2`); this client honours it only on a first run, so a returning user lands on Home instead.

The note at the bottom of the sign-in screen is deliberate. `/api/auth` checks no credential, so the UI says so rather than implying a login happened.

4:46

B2B Credit Recovery & Verification

Intro

Client portal

Admin desk

Sign in

Create account

Administrator email

No match, and the server hands back the first owner account instead - or creates one.

Admin passkey

Sent as 'password'. The handler accepts the field and never compares it, so any value opens the desk.

Fill sample admin credentials

Open admin desk

Continue without signing in

What sign-in does here

- /api/auth performs no authentication. login_client ignores credentials entirely and login_admin accepts a password it never compares.
- No token or cookie comes back, and no other endpoint in this app sends one. Choosing a portal changes what you are shown, not what you are allowed to reach.
- Creating an account writes a real row to the server's database. Signing out here only clears the copy stored on this phone.

- Creating an account writes a real row to the server's database. Signing out here only clears the copy stored on this phone.

2. Home dashboard

Wallet balance reads "Not exposed" because no endpoint returns it — `main` emits it once, inside the login response. The gateway card marks `verificationGateway`, `policyEngine`, `riskScoringEngine` and `voiceSystem` as hardcoded literals rather than probes, because that is what `/api/health` actually returns.

3. Navigation

4. Legal help — every tab

`main` renders its `SupportDrawer` on every page through `AppShell`; the same content sits behind the help icon in the top bar here.

The TRAI tab records a disagreement inside `main` itself: the 09:00–18:00 window and the three-per-day cap are enforced on the policy tick, but the direct voice action skips both.

The inquiry form is inert on purpose: `main` has no endpoint behind it, and its handler only flips a local flag, so this copy says so instead of implying a ticket was filed.

5. Business Check

The deepest module — verification, financial intelligence and the Green/Amber/Red flag.

4:48

Business Check

Business Check

Verification and financial intelligence on the businesses you sell to.

Compare

How this data was collected

Business Check runs in public-data mode. MCA, GST, Udyam and eCourts records are not fetched from government APIs: an operator opens the portal, reads the page and types in what they saw, and the server files it as USER_PROVIDED. Financial figures come from documents you upload. Nothing on these screens is independently verified.

MCA, GST, Udyam and eCourts records are marked `USER_PROVIDED` and tinted amber, never green: in `main` an operator reads the government portal and types in what they saw. The provenance is a product feature, not a defect to hide.

Two businesses can be compared side by side. `main` caps the selection and drops the oldest choice once a third is added; this client follows the same rule.

Policy ladder

Deterministic rules — no model decides the level.

L1 · Polite reminder

POL-L1-001

Under 30 days overdue and fewer than 4 L1 attempts. Channel rotates WhatsApp → Email → SMS by attempt count. Next tick is scheduled in 24h when the balance is above ₹5,00,000, otherwise 72h.

4:52

Payment Recovery

Escalation ladder

Policy ladder

Deterministic rules — no model decides the level.

L1 · Polite reminder

POL-L1-001

Under 30 days overdue and fewer than 4 L1 attempts. Channel rotates WhatsApp → Email → SMS by attempt count. Next tick is scheduled in 24h when the balance is above ₹5,00,000, otherwise 72h.

L2 · Firm multi-channel engagement

POL-L2-001

30+ days overdue, or 4 or more L1 attempts. Channel rotates Voice → WhatsApp → Email → SMS by L2 attempt count. Voice attempts are checked against the 09:00–18:00 IST window, a 2-call daily cap and a 3-hour cool-off. Next tick in 48h.

L3 · Statutory demand notice

POL-L3-NOTICE-001

90+ days overdue, or 60+ days with 3 or more L2 attempts, and no notice served yet. Creates a LegalNotice row with a reference id of the form IT-GST-<date>-<hash>. That id is generated locally; nothing is filed with the Income Tax or GST portal.

L3 · In-house arbitration

Two warnings on these screens are load-bearing. Every action posts immediately with no confirmation and no undo. And "Place L2 voice announcement" dials nobody — the server derives call outcome, duration and SIP session id from a digit sum of the phone number, then writes a **Call** row as if it had happened, skipping the TRAI calling-window and frequency-cap checks that the policy tick applies.

Record settlement

Greenline Retail LLP

Outstanding ₹1,25,000 · due 2026-09-07

Before you submit

No duplicate detection.
The endpoint takes no idempotency key and stores nothing that would let it recognise a repeat. Posting the same payment twice subtracts it twice.

No signature or authentication.
It is documented as a settlement webhook but verifies no signature and requires no credential. Anyone who can reach the URL can zero a balance.

Three separate writes, no transaction.
The balance update, the escalation-state update and the evidence-log entry are three unwrapped calls. If one fails after another succeeded, the account is left inconsistent and nothing rolls back.

Overpayment is silently discarded.
The remaining balance is clamped with $\max(0, \dots)$. Anything above the outstanding amount is not recorded as credit and does not appear on the receipt.

A blank amount settles everything.
A missing or non-positive amount makes the server apply the full outstanding balance.

Amount received (₹)

Leave blank to settle the entire outstanding balance.

Payment mode

UPI

NEFT

Amount received (₹)

Leave blank to settle the entire outstanding balance.

Payment mode

UPI

NEFT

RTGS

NET BAN

Bank UTR / reference

Left blank, the server mints an id from a hash of the amount and timestamp. That is not a bank reference.

Payer name

Defaults to Greenline Retail LLP.

What the server will do

Current balance	₹1,25,000
Amount applied	₹1,25,000 (full balance)
Balance after	₹0
Account status after	settled · escalation

`/api/recovery/settle` writes the balance, the escalation state and the evidence log as three separate un-wrapped calls, with no idempotency key and no signature check, and silently discards overpayment through `Math.max(0, ...)`. A replayed webhook applies twice. The screen warns before you submit rather than after.

8. Arbitration

The MSMED §16 engine: RBI bank rate, the statutory 3× multiplier, and compound interest with monthly rests. The rate is a constant in the server's calculator — nothing reads a live RBI notification — and the screen states that.

9. Trust Hub

`/api/trust-hub/verify` synthesises PAN, GSTIN and CIN from a hash of the company name. Those are labelled for what they are rather than presented as verified records.

10. Vendors

11. Background check

RUN A CHECK

Background Check

GST Supreme Report - OTP flow

Two calls: otp-initiate creates a session, otp-verify stores a report.

THIS IS NOT A VERIFICATION STEP

otp-verify accepts a code and never checks it - verifyGstSupremeOtp reads only the session id, so any six digits produce the same report. The flow is an audit trail of who clicked, not proof that the taxpayer consented.

Step 1 - request a session

GSTIN

27AAECG1234H1Z5

Authorised signatory mobile

9876543210

The mobile is used only to build the message text below; the server defaults it to 9876543210 when blank.

Request OTP session

`/api/verification/otp-verify` declares an `otp` parameter and never reads it, so any code is accepted. The screen does not claim the code was validated.

This build attaches no credentials to any request, because the server checks none. Its routes read no token, cookie or signature, and POST /api/auth returns a user record without ever validating a password.

Four languages, ported verbatim from `main`'s `translations.ts`. `main` declares seven language codes but ships strings for only four, so the other three are not offered.

15. Languages

Selecting a language re-renders the whole app immediately and the choice survives a restart.

Entries that keep their English label do so because `main` has no translation key for them: its table covers the nine sections it shipped, not every route. Translating the rest would mean inventing copy `main` never had.

16. Dark theme

`main` defaults to bright mode on launch and offers a class-based toggle. The Android build has the same three options — bright, dark, follow system — persisted on the device.

The web console builds this page by querying the database directly; there is no admin overview endpoint. What you see here is composed from /api/admin/customers and /api/admin/financials only, so the pipeline, marketing-attribution and activity-feed panels of the web page have no counterpart on this screen.

Health is recomputed per request from activity, wallet balance and report consumption; the stored `Company.healthScore` column is ignored, so the labels can disagree with the database. The screen says so.

Revenue by module

Latest month's gross revenue, split across the five product areas.

Background Check & Verification Gateway

85% · ₹25,33,000

Payment Recovery & Voice Outbound Engine

4% · ₹1,19,200

Vendor Registration & Bulk KYC

9% · ₹2,68,200

Trust Hub & Community Defaults

2% · ₹59,600

This split is not billing data. The server weights row counts - wallet pulls, calls x5, vendors x10, community defaults x8 - and applies those percentages to one month of gross revenue. Treat it as an allocation of activity, not as revenue actually invoiced per module.

Trailing months

At most twelve rows, newest first, straight from MonthlyFinancial.
